# Bed Bug Killer

Residual killing power against bed bugs,  
non-toxic to passengers and crew.

**“Bed bug populations have become highly resistant to pyrethroid insecticides which is commonly used by pest control companies.”**

## **Kills bed bug right where they live**

Permagard Aviation Bed Bug Killer is an aircraft cabin approved desiccant insecticide that works by absorbing the waxy water proof coating so the bed bugs die of dehydration. It can be carried back to a harbourage by an individual bed bug, killing the nest.

Permagard Aviation Bed Bug Killer has been approved by the Australian Pesticides and Veterinary Medicines Authority (APVMA) and has been tested to Boeing and Airbus standards.

## **Safe to use in all the common harbourages where bed bugs are likely to live and breed**

- Non-toxic, no odour, no exclusion time after application
- A safer toxic-free environment for passengers and crew
- Eco-friendly

## **Discrete and targeted application method**

- AMM Supplement and Entomologist endorsed specialised application procedure
- Long lasting if undisturbed
- No need to cover everything before the application
- Professional cordless applicator machine used for targeted application

“Bed bug populations have developed resistance to multiple insecticide groups and, in particular, that they have become highly resistant to pyrethroid insecticides which is commonly used by pest control companies.”

Despite this, and due to a general scarcity of alternative control options, when faced with a bed bug infestation both pest management professionals (PMPs) and residents of infested properties continue to apply insecticides in attempts to achieve control.”

– **Stephen L. Doggett, Australia’s leading Entomologist and Bed Bug expert**
